

# the shell

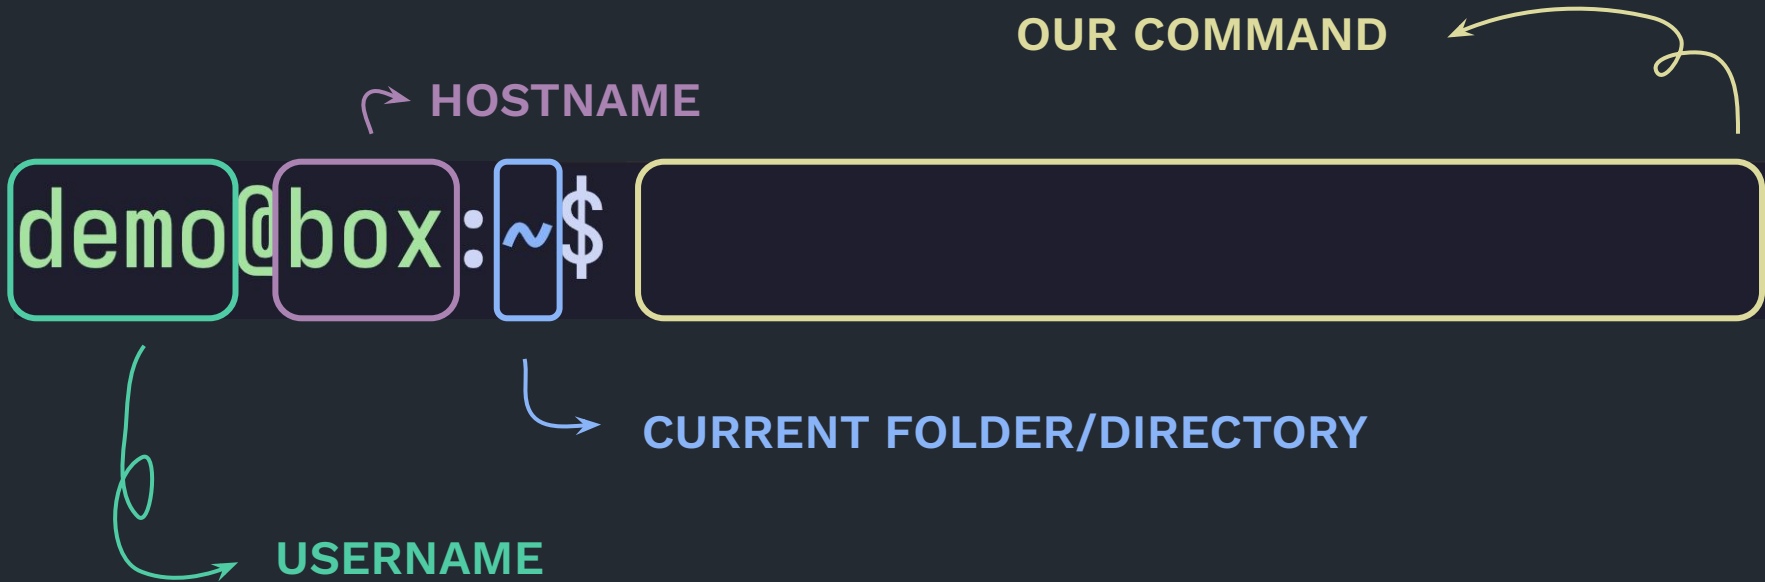

- A textual interface that we use to interact with the operating system.
- We will do almost everything in this workshop purely through the shell :)

```
demo@box: ~$ cowsay "hello world"

  ____ 
< hello world >
  -----
   \      ^__^
    \      (oo)\_______
      (__)\       )\/\
         ||----w |
         ||     ||

demo@box: ~$
```

# the prompt

\* the tilde (~) is used as a short form to represent the HOME DIRECTORY  
"/home/demo"

```
demo@box:~$ cowsay "hello world"
```

```
_____  
< hello world >  
-----
```

```
      ^  ^  
      _  _  
     (oo)\_____  
      (__)\       )\/\  
           ||----w |  
           ||     ||
```

# commands

```
$ command --flags arguments
```

- **command** — program/command that is being executed (i.e. cowsay)
- **flags\*** — specify how a command should be executed (options)
- **arguments\*** — input that is passed into the command

*\* optional – not all commands requires flags or arguments*

```
demo@box:~$ cowsay -e XX -T U "hello world"
```

```
< hello world >
```

```
-----
```

Can you identify the command, the flags and the arguments?

```
      ^  ^  
      _  _  
      (XX)\_____  
      ( _ )\      )\/  
      U ||-----w |  
        ||           ||
```

# how to use XXX?

```
$ command --help
```

```
$ man command
```

Consult the command's **help** page or the  
linux **manual** page!

# Directory Navigation

ls	List files in the specified directory
pwd	Present Working Directory
cd	Change current directory

# File Management

ls	List files in the specified directory
cp	Copy (File/Folder)
mv	Move/Rename (File/Folder)
rm	Remove/Delete (File/Folder)
touch	Create a new empty file
cd	Change current directory

# Network-Related

ssh	Access a remote system
wget	Download remote files from the web
curl	Access and view website contents
ping	Check connectivity with an IP address
ip	View IP configuration
nc	Connect to a remote service

# challenge!

we have a remote service running on  
**challs.nusgreyhats.org** on port **XXXX**

**pw: cowsay\_i\_wuv\_OS!**
